

J-Wave Activation Switch

Slim Profile, Germ-free Automatic Door Activation Switch

Product Summary

The J-Wave is a highly sensitive, high performance switch designed to activate automatic doors by detecting the movement of a person or object therefore allowing a touch-free and contactless method of access and automation throughout a building to facilitate the movement of building users. The switch is slim and aesthetically pleasing and the constantly illuminated LED light against the dark cover makes it an ideal choice in terms of ease of visibility, particularly against bright or bland walls. The touchless design is also key to reducing the spread of germs in buildings.
